Lab 0

Cuestiones del Laboratorio 0

¿Por qué es necesario borrar la configuración de inicio (*startup-config*) antes de volver a cargar el router?

Se borra para garantizar que el dispositivo arranque sin configuraciones previas y se pueda trabajar desde cero.

Después de guardar la *running-config* como *startup-config*, encuentras un par de problemas de configuración, por lo que realizas los cambios necesarios para solucionar esos problemas. Si ahora se quisiera reiniciar el dispositivo, ¿qué configuración se aplicaría después del reinicio?

Si reinicias sin volver a guardar, el dispositivo perderá los cambios de la *running-config* y cargará de nuevo la *startup-config* (con la configuración de antes de borrar).

Por tanto, después del reinicio se aplicaría la configuración incorrecta (la guardada en *startup-config*), no la corregida.

Para que los cambios buenos persistan, habría que hacer:

```
copy running-config startup-config
```

Lab 1

Cuestiones del Laboratorio 1

Preguntas paso 5:

a) Revisa la configuración en ejecución mediante el comando:

```
Router# show running-config
```

¿Qué problema ves en la salida de este comando?

Podemos ver el texto en claro de la contraseña que acabamos de configurar.

b) Revisa ahora la configuración de inicio mediante el comando:

```
Router# show startup-config
```

¿Qué problema ves en la salida de este comando?

Este comando nos muestra una salida vacía, ya que los cambios que se han efectuado y aparecen en la running-config, no los hemos consolidado en la startup-config, por lo que si el router llega a reiniciarse perderíamos la configuración.

Preguntas paso 6:

a) ¿Qué contraseña debes usar para acceder al modo privilegiado? ¿Qué puedes concluir acerca de la prevalencia de contraseñas? Revisa la configuración en ejecución mediante el comando:

```
Router# show running-config
```

La contraseña que debemos utilizar para acceder al modo privilegiado es **bayern**.

La conclusión es que prevalece la contraseña creada con **enable secret**.

b) ¿Qué conclusiones puedes sacar con respecto a los comandos **enable password** y **enable secret**?

Si utilizamos el comando **enable password** la contraseña aparece en claro en la running-config, en cambio, con el comando **enable secret** se almacena usando un algoritmo de hashing unidireccional.

Con esto concluimos que con **enable password** la seguridad es prácticamente nula y **enable secret** es mucho más seguro, por lo que para almacenar la contraseña para acceder al modo privilegiado usaremos el segundo comando.

Así se ven ambas contraseñas en la running-config:

```
enable secret 5 $1$iaUf$/YbICUZAx7Df3Gwn6CYTC1
enable password munics
```

c) ¿Qué sucedería si en este momento reinicias el equipo con el comando reload?

Tras **reload**, si no se guarda la running-config, se perderán los cambios.

d) ¿Al rearrancar el router, qué sucedería si no recordases la contraseña de acceso a través de consola o la contraseña de acceso al modo privilegiado? ¿Qué se te ocurriría para intentar solucionar el problema?

Realizamos el proceso de recuperación de clave, los routers y switches tienen un método de recuperación de contraseñas. De hecho en los siguientes laboratorios (2 y 3) trabajaremos con ello.

```
Router>ena
Router#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)#line console 0
Router(config-line)#login
% Login disabled on line 0, until 'password' is set
Router(config-line)#password munics
Router(config-line)#end
Router#
*Sep 29 10:52:50.239: %SYS-5-CONFIG_I: Configured from console by console
```

```
Router>ena
Router#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)#enable password munics
Router(config)#end
Router#
*Sep 29 10:54:39.451: %SYS-5-CONFIG_I: Configured from console by console
```

User Access Verification

Router(config)#enable secret bayern  
Router(config)#end  
Router#  
*Sep 29 11:02:49.267: %SYS-5-CONFIG_I: Configured from console by console
```

Lab 2

1. Para acceder al modo de recuperación de contraseñas en el router, primero tendremos que apagar y encender el router manualmente.

Justo después debemos de pulsar Break en la secuencia de encendido varias veces.

A continuación veremos que el router arranca en modo ROMMON.

The screenshot shows a PuTTY window titled "COM5 - PuTTY". The terminal output displays the following text:

```
Total memory size = 512 MB - On-board = 512 MB,
CISCO1941/K9 platform with 524288 Kbytes of main memory
Main memory is configured to 64/-1(On-board/DIMM)

 Readonly ROMMON initialized
 program load complete, entry point: 0x80803000
 program load complete, entry point: 0x80803000

monitor: command "boot" aborted due to user interrupt
rommon 1 >
```

A context menu is open over the terminal window, showing options like Restaurar, Mover, Tamaño, Minimizar, Maximizar, Cerrar (Alt+F4), Copy, Paste, Special Command, and Break.

2. Dentro del modo ROMMON, debemos establecer el valor del registro de configuración a **0x2142**, como se puede ver en la siguiente imagen. De esta forma estaremos omitiendo la configuración de inicio donde se almacenan las contraseñas.

The screenshot shows a black terminal window with the following text:

```
monitor: command "boot" aborted due to user interrupt
rommon 1 > confreg 0x2142

rommon 2 > reset
```

3. En **startup-config** podremos ver la configuración anterior del router, la que en un principio hemos ignorado. Seguiremos copiando la **startup-config** a la **running-config**, para pasar a la configuración anterior.

The screenshot shows a terminal session on a Cisco router. The commands entered are:

```
Router# copy startup-config running-config
Destination filename [running-config]?
.license boot c1900 technology-package datak9
^
: Invalid input detected at '^' marker.

.315 bytes copied in 0.148 secs (8885 bytes/sec)

Router#
```

4. Como el router ya está en modo privilegiado, aprovecharemos para editar la contraseña de acceso y la del modo privilegiado, y de esta forma recuperar el acceso a ambas. Y para continuar guardaremos la running-config (con las contraseñas nuevas) en la startup-config mediante el comando **wr**.

```
Router#  
Router#  
Router#  
Router#  
*Sep 30 09:26:25.823: %SYS-5-CONFIG_I: Configured from console by console  
Router#  
Router#conf t  
Enter configuration commands, one per line. End with CNTL/Z.  
Router(config)#enable secret bayern  
Router(config)#line console 0  
Router(config-line)#password munics  
Router(config-line)#end  
Router#  
*Sep 30 09:26:59.675: %SYS-5-CONFIG_I: Configured from console by console  
Router#wr  
Building configuration...  
[OK]  
Router#
```

5. Para finalizar, debemos editar de nuevo el valor del registro a su valor por defecto para que la startup-config se cargue cuando se arranca el router.

```
Router#  
Router#ena  
Router#show version | include Configuration  
Configuration register is 0x2142  
Router#configure terminal  
Enter configuration commands, one per line. End with CNTL/Z.  
Router(config)#config-register 0x2102  
Router(config)#show version | include register  
^  
% Invalid input detected at '^' marker.  
  
Router(config)#end  
Router#configure terminal  
*Sep 30 09:28:30.955: %SYS-5-CONFIG_I: Configured from show version | include Configuration  
Configuration register is 0x2142 (will be 0x2102 at next reload)  
Router#reload  
  
System configuration has been modified. Save? [yes/no]: yes  
Building configuration...  
Router#
```

Lab 3

1. Primero observamos cómo aparece cuando no podemos acceder.

```
User Access Verification  
  
Password:  
Password:  
Password:  
% Bad passwords
```

2. Para poder acceder al modo de recuperación de contraseñas, primero debemos apagar y encender el switch de forma manual.

Después de eso, mantenemos presionado el botón **Mode**, más o menos 15 segundos, mientras el LED parpadea en verde, hasta que cambia a ámbar parpadeando y luego a verde continuo. Cuando esto suceda, aparecerá por pantalla lo siguiente

```
The system has been interrupted prior to initializing the  
flash filesystem. The following commands will initialize  
the flash filesystem, and finish loading the operating  
system software:
```

```
flash_init  
boot
```

3. Escribimos **flash_init** para iniciar el sistema de archivo de la memoria flash.

```
switch: flash_init  
Initializing Flash...  
flashfs[0]: 550 files, 19 directories  
flashfs[0]: 0 orphaned files, 0 orphaned directories  
flashfs[0]: Total bytes: 32514048  
flashfs[0]: Bytes used: 15497216  
flashfs[0]: Bytes available: 17016832  
flashfs[0]: flashfs fsck took 11 seconds.  
...done Initializing Flash.
```

4. Al probar a cargar los comandos de ayuda, el dispositivo no reconoce el comando.

```
switch: load_helper  
Unknown cmd: load_helper
```

5. Continuamos cargando el contenido de la memoria con **dir flash**: que nos muestra archivos de configuración. Entre ellos **config.text**, que es el que nos interesa.

```
switch: dir flash:  
Directory of flash:/  
  
 2 -rwx 156 <date> express_setup.debug  
 5 -rwx 1801 <date> AL-SW1.base.G1  
 3 -rwx 1919 <date> private-config.text.renamed  
 4 -rwx 5725 <date> AL-conf  
 7 -rwx 1919 <date> private-config.text  
549 drwx 192 <date> c2960-lanbasek9-mz.122-58.SE2  
 8 -rwx 3096 <date> multiple-fs  
 9 -rwx 1664 <date> config.text  
  
17016832 bytes available (15497216 bytes used)
```

6. Cambiamos el nombre del archivo que contiene el **startup-config** (**config.text**) para que al iniciar no se carque y ejecutamos el comando **boot** para iniciar.

- 7, Ahora, a parte de ver que nos deja entrar en el switch sin pedir contraseñas (incluso al modo privilegiado), hacemos lo mismo que antes pero a la inversa para renombrar el archivo y poder cargar la configuración en memoria.

```
Switch#rename flash:config.text.old flash:config.text
Destination filename [config.text]?
Switch#copy flash:config.text system:running-config
Destination filename [running-config]?
% Generating 1024 bit RSA keys, keys will be non-exportable...
[OK] (elapsed time was 3 seconds)
```

8. Volvemos a configurar las contraseñas como las queremos.

```
Switch#configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
Switch(config)#enable secret bayern
Switch(config)#line console 0
Switch(config-line)#password munics
Switch(config-line)#login
Switch(config-line)#end
Switch#
```

9. Y copiamos la **running-config** en la **startup-config** para poder entrar con las nuevas contraseñas.

```
Switch#copy running-config startup-config
Destination filename [startup-config]?
Building configuration...
[OK]
0 bytes copied in 0.671 secs (0 bytes/sec)
Switch#
```

Registro de configuración de routers CISCO

El registro de configuración es un valor de 16 bits en formato hexadecimal que se almacena en el hardware del equipo y controla distintos comportamientos de arranque y diagnóstico del router.

Los tres aspectos principales que gestiona son: el comportamiento de arranque del router, las opciones de carga del sistema y la velocidad de la línea de consola.

Su funcionamiento es sencillo, cuando el router se inicia, revisa su software y los archivos de configuración. Para determinar qué archivos utilizar durante el proceso de arranque, consulta el valor del registro de configuración. Según ese valor, el router decide cómo proceder en el arranque.

Estos valores se representan en la siguiente tabla:

Configuration Register	Router Behavior
0x102	Ignores break 9600 console baud
0x1202	1200 baud rate
0x2101	Boots into bootstrap Ignores break Boots into ROM if initial boot fails 9600 console baud rate
0x2102	Ignores break Boots into ROM if initial boot fails 9600 console baud rate default value for most platforms
0x2120	Boots into ROMmon 19200 console speed
0x2122	Ignores break Boots into ROM if initial boot fails 19200 console baud rate
0x2124	NetBoot www.ipcisco.com Ignores break Boots into ROM if initial boot fails 19200 console speed
0x2142	Ignores break Boots into ROM if initial boot fails 9600 console baud rate Ignores the contents of Non-Volatile RAM (NVRAM) (ignores configuration)
0x2902	Ignores break Boots into ROM if initial boot fails 4800 console baud rate
0x2922	www.ipcisco.com Ignores break Boots into ROM if initial boot fails 38400 console baud rate
0x3122	Ignores break Boots into ROM if initial boot fails 57600 console baud rate
0x3902	Ignores break Boots into ROM if initial boot fails 2400 console baud rate
0x3922	Ignores break Boots into ROM if initial boot fails 115200 console baud rate

Por defecto, el registro de configuración tiene el valor 0x2102. Con este valor, el router realiza un arranque normal y aplica la startup-config almacenada en la NVRAM. Si se desea modificar este comportamiento, existen dos formas, desde el modo ROMMON (como se ha visto en la práctica) o mediante el comando “config-register”.

Comparación de la NVRAM en routers CISCO y switches CISCO Catalyst

En la arquitectura Cisco, tanto routers como switches heredados de Catalyst utilizan un esquema en el que la startup-config, que se almacena en la NVRAM, es lo mismo a nivel lógico.

Sin embargo, a nivel de implementación física hay una variación clave: los routers Cisco tienen una memoria física NVRAM dedicada, mientras que en los switches Catalyst la startup-config se guarda en la flash.

En otras palabras, la NVRAM no existe físicamente y va "integrada" en la memoria flash. Aun así, el sistema lo implementa igualmente como nvram a nivel de comandos y línea de consola.

Por lo tanto, la diferencia fundamental es que en routers se mantiene una NVRAM dedicada, mientras que en los switches Catalyst esta se ha eliminado y su función es totalmente asumida por la flash.

Lab 4 y Lab 5

AL-SW1

Para el switch volvemos a configurar el hostname y la ip del nombre del dominio

```
AL-SW1#show running-config
Building configuration...

!
!
crypto pki certificate chain TP-self-signed-4271428480
```

Se crearon diferentes VLANs y se distribuyeron por los puertos GigabitEthernet según correspondía, como puertos de acceso:

- VLAN 739: administración (Pod1-adm)
- VLAN 16: alumnos
- VLAN 17: PDI
- VLAN 18: PAS

A mayores se activó spanning-tree portfast para permitir que los dispositivos se conecten sin esperar el proceso de convergencia STP.

```
interface GigabitEthernet0/1
switchport access vlan 739
switchport mode access
spanning-tree portfast
!
interface GigabitEthernet0/2
switchport access vlan 16
switchport mode access
spanning-tree portfast

switchport access vlan 18
switchport mode access
spanning-tree portfast
!
interface GigabitEthernet0/10
switchport access vlan 18
switchport mode access
spanning-tree portfast
!
```

Además el puerto GigabitEthernet 0/20 se estableció como troncal, ya que va a ser el encargado de transportar las distintas VLANs al dispositivo DL-SW1.

Se creó una interfaz virtual VLAN 739 (Pod1-adm) para darle al switch una dirección IP de gestión dentro de la propia red administrativa, para dar acceso remoto y control.

```
!

Gateway of last resort is not set

      10.0.0.0/8 is variably subnetted, 3 subnets, 3 masks
S          10.1.0.0/16 [1/0] via 192.0.1.1
C          10.1.239.0/24 is directly connected, GigabitEthernet0/0.739
L          10.1.239.5/32 is directly connected, GigabitEthernet0/0.739
      192.0.1.0/24 is variably subnetted, 2 subnets, 2 masks
C          192.0.1.0/24 is directly connected, GigabitEthernet0/0.4
L          192.0.1.2/32 is directly connected, GigabitEthernet0/0.4

```

CPE

Este es un router de borde externo que hace de pasarela entre la red corporativa (que nos llega desde el FW por la red interna) y el ISP.

```
CPE#show run
Building configuration...

Current configuration : 1547 bytes
!
! Last configuration change at 14:05:35 UTC Thu Oct 9 2025
!
version 15.7
service timestamps debug datetime msec
service timestamps log datetime msec
no service password-encryption
!
hostname CPE
!
boot-start-marker
boot-end-marker
!
!
enable secret 5 $1$3FPY$n.Qd8MGjf/Gdju/Fd6Ai2.
enable password munics
!
```

Se han configurado las siguientes interfaces y las siguientes VLANS:

GigabitEthernet0/0 (troncal 802.1Q hacia DL-SW1): soporte de subinterfaces para separar gestión y tránsito.

- **GigabitEthernet0/0.739** (VLAN de administración): dir 10.1.239.4/24. Uso para gestión remota.
- **GigabitEthernet0/0.3** (VLAN de tránsito con FW): dir 10.1.0.6/30. Enlace punto a punto con el firewall.

GigabitEthernet0/1 (salida a ISP): interfaz de Capa 3 en la red 192.0.1.0/24 con 192.0.1.1. La ruta por defecto hacia 192.0.1.2 y la anuncia al interior, proporcionando salida al exterior al resto del escenario.

```

!
interface Embedded-Service-Engine0/0
no ip address
shutdown
!
interface GigabitEthernet0/0
no ip address
duplex auto
speed auto
!
interface GigabitEthernet0/0.3
encapsulation dot1Q 3
ip address 10.1.0.6 255.255.255.252
!
interface GigabitEthernet0/0.739
encapsulation dot1Q 739

!
interface GigabitEthernet0/1
ip address 192.0.1.1 255.255.255.0
duplex auto
speed auto
!
```

Se configuró el enrutamiento con OSPF, en el que:

- Solo se habilita OSPF en la interfaz G0/0.3, que conecta con el firewall.
- Se anuncia la red 10.1.0.4/30 y se redistribuye la ruta por defecto que el CPE tiene hacia el ISP.

```

!
router ospf 1
redistribute static subnets
passive-interface default
no passive-interface GigabitEthernet0/0.3
network 10.1.0.4 0.0.0.3 area 0
default-information originate
!
```

Se configuró la ruta por defecto en el CPE apuntando al ISP como puerta de enlace.

```

!
ip route 0.0.0.0 0.0.0.0 192.0.1.2
!
```

Por último, se vuelve a habilitar el acceso a consola mediante telnet y línea de comandos.

```

!
line con 0
password munics
login
line aux 0
line 2
no activation-character
no exec
transport preferred none
transport output pad telnet rlogin lapb-ta mop udptn v120 ssh
stopbits 1
line vty 0 4
password munics
login
transport input telnet
!
scheduler allocate 20000 1000
!
end

```

FW

Se establece el nombre del host a FW y el dominio del laboratorio (munics.pri)

```

!
hostname FW
!
boot-start-marker
boot-end-marker
!
!
enable secret 5 $1$iaUf$/YbICUZAx7Df3Gwn6CYTC1
enable password munics
!
no aaa new-model
memory-size iomem 15
!
!

!
ip domain name munics.pri
ip cef
no ipv6 cef
!
```

La interfaz física G0/0 la conectamos al switch de distribución (DL-SW1) y transporta varias VLANs mediante subinterfaces. Cada subinterfaz representa:

- VLAN 2: enlace de capa 3 con el switch DL-SW1
- VLAN 739: red de administración (Pod1-adm)
- VLAN 740: red de servicios

La interfaz G0/1 se conecta con el CPE, simulando la frontera entre la red corporativa y el exterior.

```

interface Embedded-Service-Engine0/0
no ip address
shutdown
!
interface GigabitEthernet0/0
description Trunk to DL-SW1 F0/13
no ip address
duplex auto
speed auto
!
interface GigabitEthernet0/0.2

clock rate 2000000
!
```

Se activa el protocolo OSPF para el intercambio automático de rutas con los otros dispositivos de red (DL-SW1 y CPE).

Las interfaces que conectan con ellos participan en OSPF, mientras que las demás permanecen pasivas.

```

router ospf 1
passive-interface default
no passive-interface GigabitEthernet0/0.2
no passive-interface GigabitEthernet0/1
network 10.1.0.0 0.0.255.255 area 0
!
```

Además se habilitó el acceso mediante Telnet por consola virtual, con la contraseña munics.

```

line con 0
password munics
login
line aux 0
line 2
no activation-character
no exec
transport preferred none
transport output lat pad telnet rlogin lapb-ta mop udptn v120 ssh

line vty 0 4
password munics
login
transport input telnet
!
scheduler allocate 20000 1000
!
end

```

A continuación se muestra la tabla de rutas aprendidas y configuradas en el router, donde:

- C: representan las redes locales configuradas directamente en las interfaces del FW
- L: representan las direcciones IP asignadas a las interfaces del propio FW.
- O: son las rutas que obtenemos gracias a aplicar OSPF.

```

FW#show ip route
Codes: L - local, C - connected, S - static, R - RIP, M - mobile, B - BGP
      D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area
